

# Streck Transport

## Streck Transport Selects BluJay Solutions Customs Management

### CHALLENGE

**Transport, logistics, and customs specialist, Streck Transport is based in Lörrach, Baden-Württemberg, a province of Germany. The company has 17 sites in Germany and Switzerland and employs over 1,100 people.**

Streck made a list of challenges that had to be overcome for a more efficient transport management system:

- To achieve higher efficiency in technical and software support, Streck Transport wanted to move from an internally operated solution to a hosted version.
- The solution had to optimize the increasing print volume of customs documents.
- As a global transport services provider, Streck Transport wanted a professional, reliable customs software solution. Additionally, the company needed comprehensive IT capabilities for its daily core business.

### QUICK FACTS

- › International forwarding company with 88,000m<sup>3</sup> warehouse
- › Founded in 1946
- › Headquartered: Lörrach, Germany

### BUSINESS CHALLENGE

- › Streamline operations, improve visibility across global operations, and connect disjointed legacy systems.

### RESULTS

- › Using BluJay's Customs Management solution, Streck was able to optimize their customs printing process and achieve greater customs efficiency with a full range of functions from a single platform.

## SOLUTION

Blujay Solutions provided a single system to handle all of Streck Transport's critical needs, including:

- IT infrastructure is outsourced to Blujay — saving time and resources
- The complete service from Blujay eliminates administrative tasks
- Manual processing of customs documents is no longer necessary
- Customs updates, changes in the system, or other necessary upgrades to the Customs Management solution version are made by Blujay experts

Blujay Solutions' tool automatically recognizes the documents transferred from the customs system and forwards them directly to the on-site printers in Streck Transport's offices, which is usually not possible in a SaaS environment. The tool reduces Streck's workload by completely eliminating manual processing of customs documents — with about 1,000 messages coming in a day.

The IT infrastructures were transferred to Blujay data centers in four phases while operations were still going on: The first step included assigning the data cables and implementing the hardware and software at the Blujay Solutions data centers. After the hardware was ready, the data was gradually migrated to the new system

With the ASP variants from Customs Management, Streck has a complete externally hosted solution with a full range of functions. The hardware is located in Blujay's high-security data centers, removing the need to invest in additional computers, server farms or DI components, because these are integrated on Blujay's application servers. For access to the ZABIS® application, Streck Transport uses a web browser with a secure connection.

Also due to the ASP variants from Customs Management, Blujay was able to certify Streck Transport again and contribute to greater efficiency in electronic customs processing.

## **STRECK** TRANSPORT

"As a logistics provider with high customs duties, we need to rely on comprehensive, reliable customs software. With the ASP version from Blujay's Customs Management, we can get this while saving valuable time and IT resources. A wide range of work is now in the hands of Blujay specialists."
